

## Stay Safe from Cybersecurity Attacks

What steps should you take to ensure your environment is safer from cybersecurity attacks? First and foremost you must develop and document a cybersecurity policy and procedures as your framework. Buying tech products without a policy is not a recommended best practice. Using cybersecurity products alone without proper procedures will inevitably leave gaps in your line of defense. The key is to start to know what you don't know – the famous “unknown unknowns”. This is where Main Sail can assist. Our Team has experience working with hundreds of clients across all industries and of all sizes. Our architects bring a valuable outsider's perspective when analyzing your environment.

It's not just about technology. It's about:

- ⊕ identifying your key stakeholders
- ⊕ identifying what data is truly the most critical
- ⊕ identifying who the response team is when an attack occurs including vendors and consultants
- ⊕ identifying the hidden cybersecurity gaps
- ⊕ identifying cybersecurity best practices
- ⊕ identifying the best investment for cybersecurity tools and technology, and identifying as many unknown unknowns as possible

Your cybersecurity policy becomes a run-book for your organization. Main Sail will help you develop your run-book and help you with a remediation plan to close the gaps. We will also schedule health checks to make sure your policy stays up-to-date factoring in current and future cyber threats. Where do we start? We recommend an assessment and our methodology includes best practices and standards from NIST SP 800-171, ISO 20071, COBIT, CMM and others.

With the results of the assessment, we can assist your organization with creating or refining a cybersecurity policy and plan. Using these results, we can also define a remediation plan to address and fill the gaps found in our assessment and create or modify an incident response plan. We also recommend quarterly or minimally semi-annual health checks to determine that your policy is up to date considering how dynamic the cybersecurity world is. Main Sail has a comprehensive suite of offerings to provide your organization with the solutions you need to mitigate cyber threats and keep you prepared with confidence.
